

Identity Verification

Uncover inconsistencies that may indicate potential fraud

Whether you conduct business with applicants in-person or over the Internet, identity theft and associated fraud is a growing problem. Knowing an applicant's identity can be challenging, yet critical. With the right authentication tool in place, you are able to know who you are doing business with while simultaneously streamlining your application process for fast approvals. CoreLogic® Teletrack™ makes verifying the identity of consumers easy. You can access our identity verification service and receive valuable insight into the fraud risk associated with a pending transaction.

Identity verification is a process that takes consumer data, and validates that the information presented during a transaction has previously been associated with the information provided on the application. This associated data is analyzed across our data sources to help you confirm the consumer's identity and uncover inconsistencies that may indicate potential fraud. Teletrack also returns association and comparison matching information between the name, Social Security number, address, date-of-birth, and phone number using its existing charge-off, inquiry and open loan data reported from thousands of businesses across the country.

When you access our very powerful real-time data validation you receive a near instantaneous validity check. In seconds, our sophisticated technology scans records to locate and confirm identity information. With speed, accuracy and simplicity, we can help you avoid potential fraud losses.

How the Process Works

Teletrack provides you with a comprehensive package to reduce your risk when executing a transaction. The process verifies consumer identity data, reports inconsistencies with consumer information, provides match and warning factors, and delivers a confidence score. The confidence score is calculated and returned to you along with match and warning factors associated with the applicant so that you can develop a strategy around what steps may be necessary to confirm identity.

Match factors associated with the data gathered from the consumer can confirm that the Social Security number supplied is valid as well as associated with the name, date-of-birth, address, and phone number supplied. Warning factors indicate if the Social Security number is invalid, deceased, or issued prior to the date-of-birth provided.

Our fully integrated Patriot Act compliance helps you avoid transactions with individuals on the OFAC Specially Designated Nationals (SDN) list so that you can maintain regulatory compliance. Teletrack also provides address modification, which converts the address to conform with USPS standards. In an integrated environment, the data returned can be used to drive certain applicants into a queue for further verification.

FRAUD SOLUTIONS

Identity Verification Process:

- ▶ Confirms if the data provided is associated with the applicant
- ▶ Compares data to multiple sources to confirm identity
- ▶ Assesses the SSN, address, date-of-birth and phone

Access Methods

Integrated customers can deploy this solution as an add-on to standard Teletrack service. The identity verification request is seamlessly integrated with your existing service so when you request a report, an identity verification report is simultaneously generated and returned to you with consumer inquiry information.

IDENTITY VERIFICATION REPORT

Inquiring Merchant		Score: 325

DISCLAIMER			
The data used to determine an Identity Score, and to compare the input data could have errors. It is the end user's responsibility to take any additional steps they deem appropriate to verify the data independently.			

The data provided can be used to develop a report similar to the sample shown. A graphical representation of the data may include a color-coded, high/medium/low risk gauge so that you can determine the confidence level at a glance. Note: This is a sample report. The Teletrack Identity Verification solution does not provide the sample report shown. The report must be developed using the data provided by CoreLogic Teletrack.
